ABSTRACT

During this time, catering service still using manual process for managing the order data then stored in an archive. It has a high risk of damage and loss of data ordering, and also loss of information about sales reports. That is why the catering business needs Web-based Information Systems which could help the owner to manage the order data.

Based on the problems above, it will develop a customer information system which is working on handling and processing the customer data, packet data, and sales data so can helps the manager and owner in obtaining information quickly.

Catering uses an online ordering system to provide information about their optimum catering menus. Thus, customers can also use the technology of internet to make an online reservation.
