ABSTRACT

An Information System of Students' Evaluation Report at Mts Negeri Pundong is created to facilitate the school and students to see the students' progress reports, because the assessment process applied in MTsN Pundong is still using the manual system. The students' learning report is in the form of report books. The students report books can only be seen at the end of the semester, whereas with this system, students' progress reports can be accessed at any time.

An evaluation is required in the teaching and learning process, it can determine the students' comprehension level in learning the materials given by the teachers and assess the learning process, whether it is succeed or not. The Information Systems of Student Learning Evaluation focus on processing student's grade. The data processing goal is to determine the students' final grade. The final grade is obtained from the calculation of assignments scores, test scores and final test scores. Later on, not only the final grades, but also the lowest grade (minimum), the highest grade (maximum), average grade and standard deviation grade are shown in the report. The role of the teachers is inputting and changing students' grade, but the access is only for the teachers that administer the subjects, the other teachers are unable to do so, they only able to see the students' grade.

The result of students' evaluation from this program is illustrated by charts, the charts is a comparison between classes, inter-school charts, and charts per academic year. The evaluation reports are in the form of charts since the researcher believed that charts will make the display more attractive and easy to understand.
