ABSTRACT

In conducting its business, the house manager or a restaurant meal are still using *paper-based* systems or manual recording that has the risk of damaged or missing. One of the main problems of the system, namely the existence of a manager who is far from the location of the restaurant caused the manager is hard to get information that is going on in the restaurant, for example, information about each transaction that occurs between the message which of course affects the stock of raw materials for each menu of food and beverages.

In designing this system needed some *software* that among *AppServer* that includes preloaded *PHP, MySQL database, Web Server Apahe, and PHPMyAdmin*

Expected to provide facilities for the restaurant in monitoring the stock of raw materials, and can calculate the raw materials needed in memprodukasi each menu.

Keywords: *MySQL, PHP and Supplies*
